On the Betti map associated with abelian logarithms

Pietro Corvaja - Università di Udine

(after a joint work with Yves André and Umberto Zannier)

(ロ)、(型)、(E)、(E)、 E) の(の)

Let A be a complex abelian variety of dimension g.

$$A(\mathbb{C})\simeq \mathbb{C}^g/\Lambda,$$

$$A(\mathbb{C}) \simeq \mathbb{C}^g / \Lambda,$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

where $\Lambda \subset \mathbb{C}^{g}$ is a lattice of rank 2g (the period lattice).

$$A(\mathbb{C})\simeq \mathbb{C}^g/\Lambda,$$

where $\Lambda \subset \mathbb{C}^g$ is a lattice of rank 2g (the period lattice). Every point $\xi \in A(\mathbb{C})$ can be expressed by real coordinates in a basis of the lattice.

$$A(\mathbb{C})\simeq \mathbb{C}^g/\Lambda,$$

where $\Lambda \subset \mathbb{C}^{g}$ is a lattice of rank 2g (the period lattice).

Every point $\xi \in A(\mathbb{C})$ can be expressed by real coordinates in a basis of the lattice.

These coordinates are called Betti coordinates.

$$A(\mathbb{C})\simeq \mathbb{C}^g/\Lambda,$$

where $\Lambda \subset \mathbb{C}^g$ is a lattice of rank 2g (the period lattice).

Every point $\xi \in A(\mathbb{C})$ can be expressed by real coordinates in a basis of the lattice.

These coordinates are called Betti coordinates.

We denote them by $(\beta_1, \ldots, \beta_{2g}) \in \mathbb{R}^{2g}$.

We can identify the period lattice Λ with $H_1(A(\mathbb{C}),\mathbb{Z}) \subset \operatorname{Lie}(A)$.

By its corollary, given the initial position of the ball there are infinitely many directions giving rise to a periodic trajectory.

By its corollary, given the initial position of the ball there are infinitely many directions giving rise to a periodic trajectory.

This last fact can be proved by considering an n-gon inscribed in the ellipse of maximal length.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ □ のへで

By its corollary, given the initial position of the ball there are infinitely many directions giving rise to a periodic trajectory.

This last fact can be proved by considering an *n*-gon inscribed in the ellipse of maximal length. In turn, one reproves in this way the non-constancy of the Betti map (Manin's theorem).

In the general case of an abelian scheme $\mathcal{A} \to S$ one expects in general that β has *maximal rank*:

rk $\beta = \min(2g, 2\dim S)$.

In the general case of an abelian scheme $\mathcal{A} \to S$ one expects in general that β has maximal rank:

```
rk \beta = \min(2g, 2 \dim S).
```

It cannot be the case if ξ is contained in a proper subgroup scheme or if the modular map $\mu_{\mathcal{A}} : S \to \mathcal{A}_g$ associated to the family $\mathcal{A} \to S$ has lower dimensional image.

In the general case of an abelian scheme $\mathcal{A} \to S$ one expects in general that β has maximal rank:

```
rk \beta = \min(2g, 2 \dim S).
```

It cannot be the case if ξ is contained in a proper subgroup scheme or if the modular map $\mu_{\mathcal{A}} : S \to \mathcal{A}_g$ associated to the family $\mathcal{A} \to S$ has lower dimensional image.

We prove that under some 'generically satisfied' conditions on the family $\mathcal{A} \to S$, not involving the section, the Betti map of every section not contained in a proper subgroup scheme has maximal rank.

We fix a basis $(\omega_1, \ldots, \omega_g)$ of global sections of $\Omega^1_{\mathcal{A}}$, and complete it into a symplectic basis $(\omega_1, \ldots, \omega_g, \eta_1, \ldots, \eta_g)$ of $\mathcal{H}^1_{dR}(\mathcal{A}/S)$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The $g \times g$ matrix Z takes values in the Siegel's space \mathcal{H}_g , and is a holomorphic map $\tilde{S} \to \mathcal{H}_g$.

Our first result can be stated in terms of the period matrix Z.

Our first result can be stated in terms of the period matrix Z.

Theorem Assume dim S = g, the family has no constant part and the section is not contained in any proper subgroup scheme. If the Betti map of the section is not a submersion, then for every vector $\mu \in \mathbb{C}^g$ and every $\tilde{s} \in \tilde{S}$, there exists a non-zero derivation $\partial \in T_{\tilde{s}}(\tilde{s})$ such that $\partial(Z \cdot \mu) = 0$.

Our first result can be stated in terms of the period matrix Z.

Theorem Assume dim S = g, the family has no constant part and the section is not contained in any proper subgroup scheme. If the Betti map of the section is not a submersion, then for every vector $\mu \in \mathbb{C}^g$ and every $\tilde{s} \in \tilde{S}$, there exists a non-zero derivation $\partial \in T_{\tilde{s}}(\tilde{s})$ such that $\partial(Z \cdot \mu) = 0$.

This result can be interpreted in the frame of the Kodaira Spencer map.

A complete classification of the cases when the rank of β is not maximal can be achieved in relative dimension \leq 3.

Let $\mathcal{A} \to \mathcal{M}_{0,2g+2} \cong (\mathbb{P}^1 \setminus \{0,1,\infty\})^{2g-1}$ be the jacobian of the universal hyperelliptic curve of genus g > 0,

Let $\mathcal{A} \to \mathcal{M}_{0,2g+2} \cong (\mathbb{P}^1 \setminus \{0, 1, \infty\})^{2g-1}$ be the jacobian of the universal hyperelliptic curve of genus g > 0, defined by the equation

$$y^2 = x(x-1)(x-s_1)\cdots(x-s_{2g-1}).$$

Let $\mathcal{A} \to \mathcal{M}_{0,2g+2} \cong (\mathbb{P}^1 \setminus \{0, 1, \infty\})^{2g-1}$ be the jacobian of the universal hyperelliptic curve of genus g > 0, defined by the equation

$$y^2 = x(x-1)(x-s_1)\cdots(x-s_{2g-1}).$$

By Torelli's theorem, one has dim $\mu_{\mathcal{A}}(S) = 2g - 1$.

Let $\mathcal{A} \to \mathcal{M}_{0,2g+2} \cong (\mathbb{P}^1 \setminus \{0, 1, \infty\})^{2g-1}$ be the jacobian of the universal hyperelliptic curve of genus g > 0, defined by the equation

$$y^2 = x(x-1)(x-s_1)\cdots(x-s_{2g-1}).$$

(日) (同) (三) (三) (三) (○) (○)

By Torelli's theorem, one has dim $\mu_{\mathcal{A}}(S) = 2g - 1$.

Theorem Let *S* be a finite cover of $(\mathbb{P}^1 \setminus \{0, 1, \infty\})^{2g-1}$, $\xi : S \to \mathcal{A}$ be any non-torsion section. After replacing *S* by a suitable dense Zariski-open subset, β becomes a submersion.

$$y^2 = (x^2 - 1)(x - s_1) \cdots (x - s_{2g}).$$

$$y^2 = (x^2 - 1)(x - s_1) \cdots (x - s_{2g}).$$

For s_1, \ldots, s_{2g} pairwise distinct and distinct from ± 1 the affine curve is smooth and has two points in the completion $\mathbb{A}^2 \hookrightarrow \mathbb{P}^2$.

$$y^2 = (x^2 - 1)(x - s_1) \cdots (x - s_{2g}).$$

For s_1, \ldots, s_{2g} pairwise distinct and distinct from ± 1 the affine curve is smooth and has two points in the completion $\mathbb{A}^2 \hookrightarrow \mathbb{P}^2$. Let ∞^+, ∞^- be these points, and $\xi = \xi(s_1, \ldots, s_{2g})$ be the class of $[\infty^+] - [\infty^-]$ in the jacobian.

$$y^2 = (x^2 - 1)(x - s_1) \cdots (x - s_{2g}).$$

For s_1, \ldots, s_{2g} pairwise distinct and distinct from ± 1 the affine curve is smooth and has two points in the completion $\mathbb{A}^2 \hookrightarrow \mathbb{P}^2$. Let ∞^+, ∞^- be these points, and $\xi = \xi(s_1, \ldots, s_{2g})$ be the class of $[\infty^+] - [\infty^-]$ in the jacobian.
A real case in the hyperelliptic context.

$$y^2 = (x^2 - 1)(x - s_1) \cdots (x - s_{2g}).$$

For s_1, \ldots, s_{2g} pairwise distinct and distinct from ± 1 the affine curve is smooth and has two points in the completion $\mathbb{A}^2 \hookrightarrow \mathbb{P}^2$. Let ∞^+, ∞^- be these points, and $\xi = \xi(s_1, \ldots, s_{2g})$ be the class of $[\infty^+] - [\infty^-]$ in the jacobian.

Theorem The set of real points $s = (s_1, \ldots, s_{2g}) \in \mathbb{R}^{2g}$ such that $\xi(s)$ is torsion is dense in the euclidean topology.

$$\theta_{\mathcal{A}}: \ T_{\mathcal{S}} \otimes (\operatorname{Lie} \mathcal{A})^{\vee} \to \operatorname{Lie} \mathcal{A}$$

the symmetric matrix T_{∂} is the matrix of the Kodaira Spencer map with respect to the basis $(\omega_1, \ldots, \omega_g)$ of $(\text{Lie } \mathcal{A})^{\vee}$ and η_1, \ldots, η_g of $\text{Lie } \mathcal{A}$.

In the case dim S = g, the condition in our result can be rephrased:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

$$\theta_{\mathcal{A}}: \ T_{\mathcal{S}} \otimes (\operatorname{Lie} \mathcal{A})^{\vee} \to \operatorname{Lie} \mathcal{A}$$

the symmetric matrix T_{∂} is the matrix of the Kodaira Spencer map with respect to the basis $(\omega_1, \ldots, \omega_g)$ of $(\text{Lie } \mathcal{A})^{\vee}$ and η_1, \ldots, η_g of $\text{Lie } \mathcal{A}$.

In the case dim S = g, the condition in our result can be rephrased: If the Betti map does not have generically maximal rank 2g, then

$$\forall \omega \quad \exists \partial \neq 0, \quad \theta_{\partial}(\omega) = 0.$$
